

ABSTRACT

An apparatus for securing inhalation of substantially smokeless air from a smoky room, which apparatus comprises a protection that is arranged over at least a user's nose and mouth, a tightly arranged tubular body that is connected to the protection and that forms a length in an elongated condition that at least extends to adjacent ground level, a nozzle arranged at an end of the tubular body at the inside of the protection adapted to placed against the user's mouth, which communicates with an air inlet opening in another end of the tubular body, and wherein the tubular body, which is formed of flexible material, and the protection are compactable to and/or expandable from a folded condition that forms a single package having substantial propagation in one plane and requiring little space.
